

A1 seven-condition falsifier: World-State content is not the task-specific
signal (five of six perturbations vs. real WS are statistically indistinguishable)
chance = 33.3%

*condition (g) is a separate checkpoint (World-State input branch removed entirely) — no pairwise bootstrap CI vs (a) exists across different checkpoints. CI text inside each bar is the paired bootstrap delta of that condition's accuracy vs. condition (a), n_boot=10,000 (A1_PROVENANCE.txt).
